

This UML diagram represents the structure behind the Identifier Manager. It starts the getPatientData class where the user would input anything know about the person , either his contact , name his social security number , with which the data manager would check if the information is valid enough that you can pinpoint the specific person , or whether it is too broad like gender or such, if it is verified it compares all of patient to find the one that has this specific identifier after which it returns the patientId such that you can use it to find anything you want.
